Hull

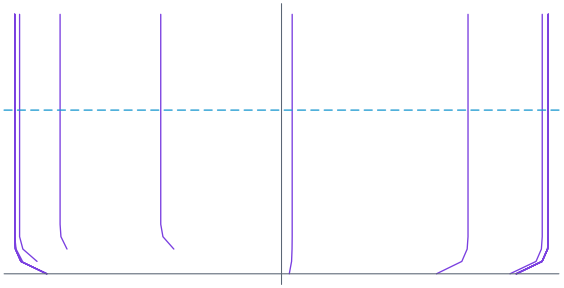

Length overall	**250.00 m**
Beam	**44.00 m**
Depth	**21.40 m**
Draught	**13.50 m**
Block coefficient Cb (estimate)	**0.907**
Displaced volume (estimate)	**134,709 m³**
Displacement in sea water (estimate)	**138,076 t**

Source: Drawn from the hull contours picked on the drawing (Edit hull). Cb = displaced volume / (L x B x T), with the length overall: it is lower than the Cb on the waterline length.

How the drawing was read

Drawing: GA_Tanker_Example.pdf, page 2 (a vector drawing), turned 90 degrees clockwise.
Engine: Compartments from the lines of the PDF (vector drawing): every closed area of every titled view became a block.
Scale: 2.052 drawing units per metre along the length (compartments: the length overall (250 m) over the longest view).

Views

#1 deck "UPPER DECK"
#2 tank "TANK TOP"
#3 profile "PROFILE"
#4 section "MIDSHIP SECTION"

Deck heights

TANK TOP: z = 2.40 m
UPPER DECK: z = 21.40 m

Notes of the analysis

- Compartments from the lines of the PDF: 410 blocks from 4 views (scale from the length overall (250 m) over the longest view).

Assumptions

- A block of a deck plan reaches from its deck up to the next plan above; on the highest plan it is 2.8 m high when named, 0.5 m when an open area.
- Blocks found only in the profile get half the beam as their width, centred (marked "width assumed").
- A double bottom is added under the lowest plan when it stands 1 m or more above the baseline.
- Volumes are those of the block shapes (box, cylinder ...), not of the real tanks: they ignore the hull shape and the structure.
- All values are estimates read from a drawing. Check them before any use.
